## Energy efficiency Data Set

Download: [Data Folder](#), [Data Set Description](#)

**Abstract:** This study looked into assessing the heating load and cooling load requirements of buildings (that is, energy efficiency) as a function of building parameters.

<b>Data Set Characteristics:</b>	Multivariate	<b>Number of Instances:</b>	768	<b>Area:</b>	Computer
<b>Attribute Characteristics:</b>	Integer, Real	<b>Number of Attributes:</b>	8	<b>Date Donated</b>	2012-11-30
<b>Associated Tasks:</b>	Classification, Regression	<b>Missing Values?</b>	N/A	<b>Number of Web Hits:</b>	73829

### Source:

The dataset was created by Angeliki Xifara ([angxifara '@' gmail.com](mailto:angxifara '@' gmail.com), Civil/Structural Engineer) and was processed by Athanasios Tsanas ([tsanasthanasis '@' gmail.com](mailto:tsanasthanasis '@' gmail.com), Oxford Centre for Industrial and Applied Mathematics, University of Oxford, UK).

### Data Set Information:

We perform energy analysis using 12 different building shapes simulated in Ecotect. The buildings differ with respect to the glazing area, the glazing area distribution, and the orientation, amongst other parameters. We simulate various settings as functions of the afore-mentioned characteristics to obtain 768 building shapes. The dataset comprises 768 samples and 8 features, aiming to predict two real valued responses. It can also be used as a multi-class classification problem if the response is rounded to the nearest integer.

### Attribute Information:

The dataset contains eight attributes (or features, denoted by X1...X8) and two responses (or outcomes, denoted by y1 and y2). The aim is to use the eight features to predict each of the two responses.

Specifically:

- X1 Relative Compactness
- X2 Surface Area
- X3 Wall Area
- X4 Roof Area

X5 Overall Height  
X6 Orientation  
X7 Glazing Area  
X8 Glazing Area Distribution  
y1 Heating Load  
y2 Cooling Load
